Heart Center Collection Guide

Fictional demonstration website. Not a real healthcare provider.

Three teaching exhibits

This collection guide describes three fictional exhibits arranged by the Alder Coast University Health teaching gallery. Each exhibit uses cardiology vocabulary as a subject label for a library-style display. The descriptions explain how the collection is organized; they do not give medical advice, describe a real service or report a clinical result.

Exhibit A: anatomy atlas shelf

The atlas shelf holds reproductions of general anatomy plates beside a card listing author, edition and subject terms. The card groups entries under broad headings such as heart structure, circulation and historical illustration. These labels help learners practice browsing a reference shelf and comparing a subject heading with a book title.

Exhibit B: instrument history case

The history case presents replicas of measurement instruments from different eras. Its timeline emphasizes changes in materials and design vocabulary, not diagnostic performance. A catalogue sheet records the display name, approximate period, material and exhibit section for each object. Every date and object description is part of the invented exhibit.

Exhibit C: community poster archive

The poster archive places sample public-education graphics beside notes about typography, audience labels and publication context. Visitors can compare how the word cardiology appears in a subject line, a caption and an index entry. The posters contain no real contact information and make no recommendations about care.

Collection organization

The gallery index groups these materials as an academic collection connected to the fictional Heart Center. The exhibits remain distinct: the atlas shelf is a print reference collection, the instrument case is a design-history display, and the poster archive is a communications collection. Their shared subject vocabulary makes them useful for a search exercise while preserving a clear purpose for each item.
